

ZonicMe Creative Commerce Dossier

MyAfriart & MyYanga - Business Plan, Monetization, Market Projections, Launch Strategy, Risk and IP

Prepared July 2026 - ZonicMe Limited - Abuja - Lagos - Diaspora - Confidential

This dossier covers ZonicMe's two creative-commerce platforms in two distinct sections:

- **Section A - MyAfriart:** the African art marketplace, auction house, private-sale floor and art-collateral registry.
- **Section B - MyYanga:** the African fashion portal with AI virtual try-on, smart search, competitions and creator patronage.

Each section presents the monetization plan with market projections, a proposed digital launch strategy, benchmarks against comparable targeted platforms, an examination of shopping risks and the mitigations already engineered into the build, a schematic of the notification-reel monetization flow (broken out as distinct revenue lines, including sponsored giveaway and discount-code mechanics), and an intellectual-property protection review. In-application screenshots are embedded throughout so the reader can judge the UI/UX directly from this document.

A note on projections. All revenue projections in this dossier are planning scenarios, not forecasts. Assumptions are stated beside every table so they can be challenged and re-run. Naira figures use an indicative rate of NGN 1,600 = USD 1.

SECTION A - MYAFRIART

A1. What the Platform Is

MyAfriart is a full-stack marketplace and services platform for African art: a curated catalogue with Buy Now checkout, a timed auction house run to international standards (reserves, bid increments, 20% buyer's premium, anti-sniping soft close), a members-only private-sale floor ("the Sale Lounge") with escrow and brokerage, a certification and public-verification registry, a provenance ledger, and an art-backed collateral registry - all wrapped in trust infrastructure (KYC, escrow, disputes, signed webhooks) that regional competitors do not have.

MyAfriart home - the curated catalogue with multi-facet search, AI concierge, and editorial programming

The artwork grid - every piece carries artist, country, medium and price; every card is a shareable landing page

The trust layer is the moat. Anyone can list art online; very few platforms can make a stranger-to-stranger NGN 5m art transaction feel safe. Escrow, identity verification, certificates with public verification codes, and an immutable provenance ledger are what convert browsers into transactors at serious price points.

The Sale Lounge - a members-only private sales floor; the gate itself communicates exclusivity and trust

Member sign-in - Google OAuth plus email, gating the Lounge, staging renders and collateral portal

A2. Market Context & Projections

The market MyAfriart sells into

Indicator	Value	Source
Global art market (2025)	\$59.6bn, +4% year on year	Art Basel / UBS Art Market Report 2026
Online art sales (2025)	\$9.2bn (15% of the market)	Art Basel / UBS 2026
Global public auction sales (2025)	\$20.7bn, +9%	Art Basel / UBS 2026
Dedicated African art sales, major houses	\$100m+ cumulative since 2017	MoMAA African & Diaspora Outlook 2026
African-born artist auction record	\$10.7m (Julie Mehretu)	MoMAA 2026
Online auction sweet spot	63% of online auction value sits below \$50,000 per lot	Art Basel / UBS 2026

Three structural observations drive the opportunity:

- **The online segment is exactly MyAfriart's price band.** Online auction value concentrates in the \$5,000-\$50,000 range - the natural territory for contemporary African works - while trophy lots stay in live rooms. MyAfriart is not competing with Christie's evening sales; it is digitising the band the big houses serve worst.
- **African art is under-infrastructure, not under-demanded.** Dedicated African sales at Sotheby's, Christie's and Bonhams have cleared \$100m+ since 2017 with strong sell-through, yet the continent itself has no platform combining auction, escrow, certification and provenance. Consignors currently ship to London to reach trust

infrastructure. MyAfriart brings the infrastructure to the work.

- **Provenance compounds.** Every MyAfriart sale writes a provenance event; certified works resell at a premium *because* they were sold through the platform. This is a flywheel competitors cannot copy quickly, because it accrues with transaction history.

Comparable platform benchmarks

Platform	Model	What they achieved	Lesson for MyAfriart
Artsy	Global online marketplace + auctions	The category reference for online discovery-to-bid; strongest in the sub-\$50k band	Validates the online mid-market thesis; weak African coverage leaves the niche open
Saatchi Art	Direct-from-artist marketplace	Scaled a commission model on emerging artists globally	Commission-only economics work at volume, but with no trust layer the average order stays low
Sotheby's / Christie's African depts	Dedicated African sales	\$100m+ cumulative since 2017; record prices for African-born artists	Demand is proven at the top; the consignment pipeline from Africa is the bottleneck MyAfriart owns
Sotheby's Financial / Athena Art Finance	Art-secured lending	Multi-billion-dollar global category	Effectively non-existent for African art - MyAfriart's collateral registry is a first mover

Revenue lines and three-year projection (base case)

Notification reels are broken out as their own distinct lines, per the monetization plan.

Revenue line	Mechanics	Y1 (NGN)	Y2 (NGN)	Y3 (NGN)
Buyer's premium	20% on every auction hammer	14m	70m	220m
Direct-sale margin	Platform-set margin/commission on Buy Now	10m	48m	150m
Lounge brokerage	5% (tunable) on brokered private sales	6m	35m	120m
Certification services	Authentication + certificate + delivery monitoring	3m	12m	35m
Collateral registry fees	Authentication and registry fees on pledged works	2m	10m	40m
Reel: brand placements	Sponsored panes in curated reels, impression-metered	8m	40m	130m
Reel: sponsored offers	Discount-code and giveaway panes (premium pricing)	3m	18m	60m
Total		46m (~\$29k)	233m (~\$146k)	755m (~\$472k)

Assumptions: Y1 auction GMV NGN 70m (approx. 60 sold lots at NGN 1.2m average hammer), direct-sale GMV NGN 65m at ~15% blended margin, 25 brokered Lounge deals at NGN 4.8m average, growing roughly 4-5x in Y2 as the consignment pipeline and diaspora buyer base build, then ~3x in Y3. Reel revenue assumes 4 sponsor slots/month at NGN 160k average in Y1 scaling with audience. The upside case - an anchor estate consignment or a bank partnership on collateral lending - is materially above these lines and is deliberately excluded.

A3. Digital Launch Strategy

Positioning: *The only platform where African art can be discovered, staged on your wall, bought, auctioned, brokered, certified, verified, and borrowed against.*

Phase 0 - Pre-launch (weeks 1-6)

- Seed the catalogue: 150-250 authenticated works from 30-50 artists and 2-3 estates; every piece photographed and provenance-documented. Quality over volume - the first auction must feel like a real sale.
- Founding-consignor programme: waive seller commission for the first 90 days in exchange for exclusivity and stories ("the founding fifty").
- Private beta with 100 invited collectors (Lagos, Abuja, Accra, Nairobi, London, New York diaspora). KYC-verify them ahead of launch so the Lounge is liquid on day one.

Phase 1 - Launch (weeks 7-12)

- **Anchor event:** one flagship timed auction ("First Sale") with 40 lots, promoted for three weeks. Auctions create a date, urgency and press interest that a marketplace opening cannot.
- **Staging as the shareable hook:** every artwork page pushes "stage this on your wall" - each render a collector shares is an advert with the artwork in it. Room-staging renders are the organic loop.
- **Channels:** Instagram and TikTok art/interiors creators (10-15 micro-influencers, gifted staging sessions), art-press PR (the collateral registry and provenance ledger are genuine stories), targeted Meta ads to diaspora collectors in UK/US (the ANKA pattern: 40% Europe, 30% US buyers), WhatsApp broadcast lists for lot alerts.
- **Certification as marketing:** publicise the public verify URL. "Check any MyAfriart certificate yourself" is a trust claim competitors cannot make.

Phase 2 - Compounding (months 4-12)

- Monthly themed auctions (photography, women artists, Francophone West Africa) to build a calendar habit.
- Notification reels go commercial: sell sponsor panes to galleries, framers, insurers and art-fair organisers once weekly reel opens pass ~5,000.
- Collateral registry pilot with one lending partner; even 10 pledges creates a press-worthy first for African art.
- KPI gates: 60%+ auction sell-through, 25%+ reel open rate, 10+ Lounge brokerage requests/month, CAC below 15% of first-transaction revenue.

A4. Shopping Risk & Mitigation (as currently designed)

Risk	Mitigation in place	Residual exposure
Buyer pays, work never ships	Escrow: funds held by platform, released by admin only on confirmed delivery; disputes freeze escrow instantly	Admin release discipline; formalise a delivery-evidence checklist
Fake or spoofed payment confirmations	HMAC-SHA512 signed webhooks + idempotent event log + dual verification (redirect and webhook); payment is atomic - recorded fully or not at all	Low
Forged certificates	Server-registered verify codes, public check at <code>/verify/cert/{code}</code> , revocable	Low - the fraud moves off-platform where it cannot borrow the brand
Stolen or double-pledged art	Lien registry: pledged works are flagged and cannot be sold or re-pledged; KYC hard-gate on all pledging	Physical-world verification depends on the authentication workflow's rigour

Money laundering / regulatory	Risk-based KYC (always for collateral; escrow at NGN 500k+), full audit trail, attributable admin actions	SCUML registration is an open business action; do it before scale
Chargebacks and buyer conflict	In-app dispute filing, escrow freeze, atomic refund resolution, defence-file audit trail	Card-network chargebacks outside escrow flows remain possible
Damage or loss in transit	Brokerage pipeline includes delivery monitoring	Gap: no insurance partnership yet - negotiate a carrier/underwriter before high-value volume
Platform abuse / scraping	Rate limiting (120 req/min/IP), RLS on every table, malware-scanned uploads	Low

The honest summary: for on-platform escrowed transactions the design is strong - the two open items are commercial, not engineering (transit insurance, SCUML registration).

A5. Notification Reels - Flow Schematic & Monetization

Reels are MyAfriart's owned re-engagement channel and sellable ad inventory: curated artwork reels matched to member tastes, frequency-capped, with weighted sponsor panes.

Pane types and pricing logic (distinct sub-lines):

Pane type	Sponsor pays for	Why sponsors buy it
Standard brand pane	Metered impressions in a high-intent, art-only audience	Reach without social-platform noise
Discount-code pane	Impressions + unique codes; redemptions tracked at checkout	Hard attribution - they see exactly what the placement sold
Giveaway pane	Impressions + entry mechanics; platform runs the draw	Deepest engagement: entries, follows, shares and first-party data

Giveaway and discount panes are deliberately priced above standard panes: they convert the reel from an ad into a participation loop. A member who claims a framing-house discount or enters a staging-session giveaway has taken an action a banner never gets - and every redemption is proof-of-performance that renews the sponsor contract.

Frequency caps protect the asset. The reel stays valuable precisely because it is not spammed; scarcity of slots is also what holds the price floor.

A6. Intellectual Property Protection

IP asset	Instrument	Action
Source code, schema, scripts	Copyright (automatic on creation)	Register with the Nigerian Copyright Commission for evidentiary weight; US Copyright Office registration enables statutory damages for US enforcement
"MyAfriart", "ArtStage" names + logos	Trademark	File at the Nigerian Trademarks Registry (classes 9, 35, 36, 41, 42 - software, marketplace, financial services, culture, SaaS); extend via Madrid Protocol to UK/US/EU where the diaspora buyers are
Certificate of Authenticity design + verify system branding	Trademark / trade dress	Register the certificate mark; the public-verify URL pattern becomes brand infrastructure
Provenance ledger data, credibility rankings, price histories	Database rights / trade secret	Contractual protection in ToS; access-controlled; do not publish raw
Curation and ranking algorithms, valuation heuristics	Trade secret	Keep server-side (already the architecture); NDAs for staff and partners
Auction rules copy, editorial content, photography	Copyright	Platform-owned or licensed under consignment agreements - ensure the consignment contract assigns marketing-image rights
Artwork images	Licensed, not owned	Consignor agreement must grant display, staging-composite and promotional licence; artists retain their copyright

On patents: software and business methods as such are excluded from patentability in Nigeria (Patents and Designs Act), and equivalent exclusions apply in Europe. The lien-registry workflow and escrow-dispute machinery are unlikely to clear the novelty/inventive-step bar internationally given prior art in fintech. The pragmatic posture: spend the patent budget on trademarks and trade-secret discipline, and consider a **US provisional application** only if the art-collateral registry develops a genuinely novel technical mechanism (e.g., a specific cryptographic provenance-lien binding). A defensive publication of the certificate-verification scheme is a cheap way to prevent a competitor patenting it against you.

SECTION B - MYYANGA

B1. What the Platform Is

MyYanga is a portal where lovers of African fashion discover, engage and patronize African creatives - designers, photographers, makeup artists and fabric makers. Its flagship is **AI virtual try-on**: the user uploads a photo and the platform generates a photorealistic image of that person wearing selected garments in a chosen scene (wedding, corporate, owambe, evening), with itemised look pricing. Around it: SmartSearch AI with shufflable look decks, editorial spotlights, Post Your Look competitions, events, look sharing with friend comments, a six-gate freemium monetization engine with a three-provider payment cascade, and a full admin operating console with delegated rights management.

MyYanga home - editorial-first landing with the maroon-gold design language and the Virtual Wear call to action

Virtual Wear - the four-step try-on flow; the privacy promise ("your photo is used only to render your look") is stated up front

Smart Search - one query, every parameter; results assemble into complete look decks with brand and total cost

Authentication - Google OAuth first-class, founding super admin claim, and testing-phase quick-fill accounts

The Admin console - seven studios behind privilege gates; the mode pill (Testing/Production) is visible bottom-left

Access Control studio - directory, privilege map and audit log; ownership can be transferred or co-shared

Monetization studio - every feature flips between free and paid with admin-set pricing, effective immediately

B2. Market Context & Projections

The market MyYanga sells into

Indicator	Value	Source
African e-commerce users (2025)	500m+, ~40% penetration, 17% CAGR	USITA / industry analyses 2025-26
African e-commerce market	~\$277bn (2023), ~14% CAGR to 2032	Industry projections
Fashion share of MEA e-commerce	35% - the largest category	2025 category data
Virtual try-on market	\$15.2bn (2025) to a projected \$48.1bn (2030, ~26% CAGR)	Grand View Research
VTO conversion impact	+20-50% conversion; 3x add-to-cart; 25-40% fewer returns	DRESSX 2026 report; McKinsey; Shopify commerce data
Consumer pull	71% of shoppers want try-on; ~1% of stores offer it	2025 retail surveys

The strategic read:

- **Fashion is the biggest category in African e-commerce and try-on is its biggest unsolved problem.** Online apparel returns run 30-40% globally; in African logistics conditions a return is often a written-off sale. A photorealistic try-on before purchase attacks the single largest cost line in the category.

- **The try-on gap is a first-mover window.** 71% of consumers want it and ~1% of stores have it. Nobody has it for African occasion-wear - agbada, aso-oke, senator sets - where fit, drape and occasion-matching are precisely what shoppers agonise over.
- **The diaspora is the beachhead wallet.** ANKA's data shows the pattern: 80% of African fashion orders cross borders, with 40% of buyers in Europe and 30% in the US. MyYanga's virtual try-on travels perfectly - the diaspora buyer cannot walk into the Lagos tailor's shop, but she can see herself in the garment.

Comparable platform benchmarks

Platform	Model	What they achieved	Lesson for MyYanga
ANKA (ex-Afrikrea)	African fashion marketplace to SaaS + payments + logistics	\$60m+ cumulative GMV, 22,000 sellers in 47 countries shipping to 170; \$4.1m revenue (2024); raised \$13.5m (incl. IFC); acquired by Global Shop Group, Oct 2025	The demand and the diaspora corridor are proven; monetizing infrastructure (payments, promotion) outperformed pure marketplace take rates
The Folklore	African/diaspora designer platform, pivoted B2B wholesale	\$3.4m seed; placed African designers into Nordstrom, Saks, Bergdorf	Consumer-only economics were hard at boutique scale; B2B and services deepen the moat - MyYanga's creator-promotion and reel inventory follow this logic
DRESSX / VTO vendors	Try-on technology providers	1m+ shopper studies: 3x add-to-cart, +50% purchase conversion, 10x conversion in luxury cohorts	Try-on is a conversion machine, not a gimmick - but tech-only vendors lack an audience; MyYanga owns both
Drest / styling games	Fashion styling entertainment	Proved engagement economics of styling-as-play	Post Your Look and look sharing borrow the engagement loop and attach commerce to it

The competitive synthesis: ANKA proved African fashion e-commerce demand but had no experiential layer; DRESSX proved the try-on effect but has no African audience or catalogue; The Folklore proved distribution but not consumer engagement. MyYanga is the only build that combines the audience, the catalogue relationships, and the try-on experience in one place, with monetization rails already live.

Revenue lines and three-year projection (base case)

Notification reels are shown as **two distinct lines** - standard brand placements and sponsored offers (giveaways / discount codes) - as requested.

Revenue line	Mechanics	Y1 (NGN)	Y2 (NGN)	Y3 (NGN)
Feature access: Virtual Wear + SmartSearch	Per-feature pay gates, admin-priced	36m	160m	480m
Premium membership	Subscription gate	12m	60m	200m
Post Your Look entries	Paid competition entry	6m	25m	70m
Events access	Pay-gated fashion events	8m	30m	90m
Creator promotion	Paid placement in the promoted creator pool	10m	45m	140m
Reel: brand placements	Impression-metered sponsor slots in notification reels	15m	80m	260m

Reel: sponsored offers	Giveaway + discount-code panes at premium pricing	5m	35m	120m
Total		92m (~\$57k)	435m (~\$272k)	1.36bn (~\$850k)

Assumptions: Y1 25,000 registered users growing to 90,000 (Y2) and 250,000 (Y3); ~6% of monthly actives paying at least one gate at a blended NGN 2,000/month; creator promotion at 80 promoted creators (Y1) averaging NGN 10k/month; reel inventory of 6 brand slots/month at NGN 200k average in Y1, scaling with verified reach and redemption data. Not included (upside): commission on garment transactions once the retail checkout journey ships, B2B API licensing of try-on to designer webshops, and white-label reels for fashion brands.

Why reels are a big monetizer. Every other line requires the *member* to pay; reels are paid by *brands*, so they scale with audience rather than wallet. The impression-metering already built (purchased vs delivered, visible in the Reel Config studio) is what lets MyYanga sell this credibly from month one - and the giveaway/discount mechanics below turn each reel into an engagement event brands come back for.

Reel Config studio - brand placements are impression-metered: "240/1000 active", "500/500 spent". This metering is the billing backbone of the reel revenue lines

B3. Digital Launch Strategy

Positioning: See yourself in it before you buy it. The best of African fashion, in one spot.

Phase 0 - Pre-production testing (now; weeks 1-4)

- The build's Testing mode is the launch tool: every tester sign-up receives full Admin Studio rights automatically, so designers, stylists and content partners load real garments, publish editorial and exercise every flow with zero infrastructure. These rights revoke automatically at the Production switch.
- Recruit a 30-person tester cohort: 10 designers (garment uploads), 5 stylists/MUAs, 15 target users. Their

uploads become the production seed catalogue.

- Photograph the hero garments properly - try-on quality tracks garment photography quality, and this is the single highest-leverage pre-launch task.

Phase 1 - Launch (weeks 5-12): "The Owambe Engine"

- **Time the launch to wedding season.** Occasion-wear is event-driven; the wedding/owambe calendar is MyYanga's Black Friday. The launch campaign is one repeated act: *upload your photo, see yourself in the outfit, share it to your aso-ebi group chat*.
- **The share loop is the growth engine.** Every generated look carries a public share page (/look/{code}) where friends comment without an account. The try-on output is inherently viral - it is a picture of the user looking excellent. Instrument shares-per-look as the north-star metric.
- **Channels:** Instagram/TikTok fashion creators seeded with free Premium and try-on sessions (15-20 micro-influencers in Lagos/Abuja/Accra + 10 diaspora creators in London/Houston/Toronto); Meta ads targeted on engagement + diaspora corridors; WhatsApp status content packs for designers ("your garment, on your customer, before she buys"); PR on the AI try-on first for African occasion-wear.
- **Competitions bootstrap content:** Post Your Look runs free for the first 60 days; the votes gallery is the community flywheel. Introduce the entry fee only after weekly entries exceed ~200.
- **Creator side:** onboard 100 creatives with free profiles; sell promotion slots only after the discover surface has organic traffic (sell results, not promises).

Phase 2 - Compounding (months 4-12)

- Flip Virtual Wear and SmartSearch to paid tiers once weekly try-on volume passes ~2,500 renders (free tier: low-resolution or 3 renders/month; paid: unlimited + premium scenes).
- Launch reel brand placements once the notification audience passes ~10,000 opted-in members; lead with giveaway panes (they self-promote) and use redemption dashboards to close renewals.
- Ship the retail checkout journey (the current stub) and take commission on garment sales - the largest unmodelled line.
- KPI gates: 25%+ of new users complete a try-on in week one; 1.5+ shares per generated look; D30 retention 20%+; reel open rate 30%+; CAC under NGN 1,200 blended.

B4. Shopping Risk & Mitigation (as currently designed)

MyYanga's commerce model is two-lane: **feature payments** (gates, memberships, entries - fully on-platform) and **garment patronage** (currently engage-and-patronize via the creator's WhatsApp/Instagram/shop, with on-platform retail checkout stubbed for a later phase). The risk profile differs per lane and the honest assessment below covers both.

Risk	Mitigation in place	Residual exposure
Paying for a gated feature and not receiving access	Payments verified twice (redirect return + provider webhook); entitlements written server-side by <code>fulfil_payment</code> ; gates re-checked inside edge functions, not just UI	Low
Provider outage killing checkout	Three-provider cascade (Flutterwave then Paystack then Stripe) with automatic failover, order admin-configurable	Low
Spoofed payment webhooks	Webhook log + server-side verification	Deepen per-provider signature verification before high volume - currently basic
Client-side tampering to skip paywalls	All gates enforced server-side (<code>get_feature_gate</code> RPC inside edge functions); roles/privileges live only in the database in production	Low

Buyer pays a creator off-platform and is defrauded	Creator credibility ranking and promoted-pool curation reduce exposure; engagement happens on channels the buyer already trusts (WhatsApp/IG)	Structural: off-platform transactions carry no platform protection. Mitigation path: ship on-platform checkout with escrow-style payout holds, following the MyAfriart pattern
Garment doesn't look right on arrival	Virtual try-on is itself the mitigation - the buyer has seen the garment on their own body before committing; industry data: 25-40% return reduction	Fit/tailoring variance remains; add measurement capture at checkout phase
Counterfeit or misrepresented garments	Admin-curated catalogue; garment uploads privilege-gated	Scale will need a creator verification tier (borrow MyAfriart's KYC machinery)
User photo privacy	Photo used only to render the look; on-device canvas fallback never uploads; AI path processes transiently and does not persist the source photo; look saving is user-initiated	Publish the retention policy in the privacy page; NDPR (Nigeria Data Protection Act) registration as volumes grow
Refunds and disputes	Payments and entitlements are durable, auditable tables	No in-app dispute flow yet - port MyAfriart's dispute/refund machinery before scale
Testing-rights leakage into production	Testing privileges live only in localStorage; production roles come exclusively from the database; auto-revocation verified in the 42-check aggressive audit	Low

Summary: the money that flows on-platform today is well-protected; the two build-next items are per-provider webhook signature depth and the dispute flow, and the strategic move is bringing garment transactions on-platform where the trust machinery can protect them.

B5. Notification Reels - Flow Schematic & Monetization

MyYanga's reels deliver configurable fashion image reels by email, WhatsApp, web push and in-app, with brand ad slots per reel, admin-set frequency, and audience selection (all users vs premium). The Reel Config studio already meters purchased vs delivered impressions - the billing backbone.

What makes MyYanga's reel uniquely sellable: the engagement action is not "click through to a product page" - it is *"see yourself wearing it."* A brand pane that launches a try-on of that brand's garment, on the member's own photo, is ad inventory no fashion media owner in the market can offer.

Sponsored offers - giveaways and discount codes (distinct revenue line):

- Discount-code panes:** the brand buys impressions plus unique codes; members claim in one tap; redemptions

are tracked at the payment gates (and at garment checkout once live). The brand gets hard attribution; MyYanga prices the pane above standard and takes a per-redemption kicker.

- **Giveaway panes:** the brand funds a giveaway (a garment, a styling session, aso-ebi for two); members enter in-reel; the platform runs the draw and announces winners in the next reel - which lifts the *next* reel's open rate. Entries generate first-party engagement data and brand follows.
- **The incentive logic:** giveaways and codes convert passive recipients into participants. Participation deepens brand engagement, trains members to open reels (protecting open rates, which protects CPM), and produces redemption dashboards that make renewal conversations self-closing.

Inventory protection: frequency caps and a fixed ad-slot ratio per reel are already admin-enforced. Scarcity is the price floor; the reel is worth selling only for as long as it stays worth opening.

B6. Intellectual Property Protection

IP asset	Instrument	Action
Source code, schema, edge functions, audit tooling	Copyright (automatic)	NCC registration for evidence; US Copyright Office registration for US enforcement reach
"MyYanga" name, logo, "The Best of African Fashion, in one spot."	Trademark	Nigerian Trademarks Registry classes 9, 35, 38, 41, 42 (software, marketplace/advertising, communications, entertainment/competitions, SaaS); Madrid Protocol extensions to UK/US/EU/Canada diaspora markets
Editorial content, campaign imagery, mock garment assets	Copyright	Platform-owned; keep creation records
Look decks, credibility rankings, trend/search data	Database / trade secret	ToS protection; never expose raw ranking signals
Try-on orchestration (gate checks, scene prompting, canvas fallback)	Trade secret + defensive publication	The generative model is Google's; the orchestration is yours. Keep prompts and pipelines server-side. A defensive publication of the reel-offer redemption loop prevents competitors patenting it against you
User-generated looks and PYL entries	Licence via ToS	Users retain copyright in their photos; ToS must grant MyYanga a licence to host, render, and display shared looks; competition terms must cover promotional reuse of entries
AI-generated try-on renders	Contract, not copyright	AI-generated images have uncertain copyright status in most jurisdictions (no human author); govern ownership and permitted use through ToS between platform, member and garment brand rather than relying on copyright
Garment images and designs	Licensed from creators	Creator agreement must grant catalogue display + try-on compositing rights; the <i>garment design</i> itself may qualify for design protection in the creator's name - offering registration help is a creator-retention perk
Domains, handles	Registration hygiene	Secure myyanga variants (.com/.ng/.africa) and social handles now; they are cheapest before launch publicity

On patents: as with MyAfriart, software and business methods as such are not patentable in Nigeria, and the AI

try-on itself rides on a third-party model with heavy prior art (Google, Amazon and a dozen VTO vendors hold the underlying technique patents). Genuine patent spend is unlikely to return value here. The one candidate worth a **US provisional** review by counsel: a specific technical method binding reel impression-metering, per-member unique code issuance and gate-level redemption in one attribution mechanism - if counsel judges it novel. Otherwise: trademarks aggressively, trade secrets rigorously, contracts everywhere, and defensive publications where a competitor patent would hurt.

Closing Note

The two platforms share one operating thesis: **African creative commerce does not lack demand - it lacks trust and experience infrastructure.** MyAfriart supplies the trust (escrow, provenance, certification, collateral); MyYanga supplies the experience (try-on, look decks, competitions, reels). They share code patterns, payment rails, admin machinery and - deliberately - a monetization philosophy in which every feature can be free until the audience proves it should be paid, and in which the notification reel turns the audience itself into inventory that brands, not members, pay for.

Prepared for ZonicMe Limited. Confidential. Projections are planning scenarios; assumptions are stated inline and should be revisited quarterly.
